### 3. Pin Assignment of Connector

#### 3.1. Serial Interface

Communication to the MTI-3 is provided via a serial interface. A 10-pin 1.27mm whole connector is used. The pin out is shown in Table 4-1.

Pin 6 (Reset) is the active-low reset input. The MTI-3 always requires a reset at power-up, or it will not start properly. An optional onboard reset circuit can be provided. A reset forces the MTI-3 processor to reboot, but will not influence other parameters such as hot or cold start. Pin 1 (GPIO [4]) and pin 10 (GPIO [0]) are spare pins that can be used e.g. to control power modes, to indicate MTI-3 status, or to force a cold start. They can be left unconnected if desired.

I/O voltage level is set to 2.7V.

\* NMEA Tx & Rx I/O voltage level is set to 2.7V.

### 3.2. Debug Interface

A dedicated pin out (in form of test points) is provided on the board to give the possibility to connect the MTI-3 debug unit. The debug port is intended to be used only during the development stage and to download the firmware at factor setup. It is not meant to be used by the customers unless they want to develop or modify the SW of the MTI-3 module.

The debug port includes the signals required by the debug system unit (DSU). A companion DSU interface board has been already developed.

## General NMEA Format

The general NMEA format consists of an ASCII string commencing with a '\$' character and terminating with a <CR><LF> sequence. NMEA standard messages commence with 'GP' then a 3-letter message identifier. Nemerix specific messages commence with \$PNMRX followed by a 3 digit number. The message header is followed by a comma delimited list of fields optionally terminated with a checksum consisting of an asterisk '\*' and a 2 digit hex value representing the checksum. There is no comma preceding the checksum field. When present, the checksum is calculated as a bitwise exclusive of the characters between the '\$' and '\*'. As an ASCII representation, the number of digits in each number will vary depending on the number and precision, hence the record length will vary. Certain fields may be omitted if they are not used, in which case the field position is reserved using commas to ensure correct interpretation of subsequent fields.

The tables below indicate the maximum and minimum widths of the fields to allow for buffer size allocation.

### **\$PNMRX106, Datum**

This message defines the conversion model used for mapping the ECEF coordinates into the LLA ones. The default transformation uses WGS84 approximation. The transformation method can be changed into one using a reference Ellipsoid combined with a local datum, to obtain a specific estimation of the local earth geometry. Once the datum has been changed it will be applied to all LLA data, including the LLA navigation initialization Data. This message enables the receiver to be configured to use map datum from an internal table, or datum supplied as part of the message.

This message is used to reset the systems. If the message is sent without parameters the receiver reboots according to the fix procedure (hot, warm or cold) configured with the PNM RX101 or PNM RX104 messages. A second parameter can optionally be used to specify which actions are executed after the reset. If the last bit field is set to ‘1’, then the actions are repeated permanently at each reset, until this bit is cleared.

***\$PNMRX113, GPS Core Activity Control***

This message is used to disable GPS Core activities (data extraction and fix generation) on the node. The goal of this message is to disable these two functions when they need to be overwritten by external values for test purpose. A reset message must be set after the PNM RX113 in order to resume operation. For instance if a different almanac needs to be downloaded to the receiver then, data extraction must be disabled, then the new almanac can be downloaded. A reset command will then be used to restore operation with hen new almanac.

### ***\$PNMRX300, Almanac Data Transfer***

This message format is used to transfer the almanac data between nodes; it uses a packed hexadecimal format to transfer almanac data for each of the available SV's. Since the Almanac data is large and can take time to transfer over a slow serial interface, the data is divided into individual messages for each of the SV's. These messages are transmitted sequentially and can be interleaved with other messages to prevent the Almanac data blocking higher priority messages such as scheduled PVT information. The data for these messages is expressed as signed or unsigned fixed point values which have been scaled from the floating point values used in the position solution. The appropriate scaling factors are included in the table. There is 1 message for each satellite for which data is available. When transmitted these messages are generated in ascending order of SV Id, when being sent to the node these can be sent in any order, each message is individually interpreted and processed.

### ***\$PNMRX301, Ephemeris Data Transfer***

This message format is used to transfer the ephemeris data between nodes; it uses a packed hexadecimal format to transfer ephemeris data for each of the available SV's. Since the Ephemeris data is large and can take time to transfer over a slow serial interface, the data is divided into individual messages for each of the SV's. These messages are transmitted sequentially and can be interleaved with other messages to prevent the Ephemeris data blocking higher priority messages such as scheduled PVT information. The data for these messages is expressed as signed or unsigned fixed point values which have been scaled from the floating point values used in the position solution. The appropriate scaling factors are included in the table. The ephemeris data for each satellite is divided into 3 separate messages with sequence numbers to identify them, the contents of these frames reflects the contents of the appropriate subframes 1,2,3 transmitted from the SV's. When transmitted these messages are generated in ascending order of SV Id and sequence number, when being sent to the node these can be sent in any order, provided that the 3 messages for any individual satellite are grouped together, each message is individually interpreted and after a group of 3 valid messages for an SV the ephemeris for that SV is updated independently. The 3 message formats are illustrated in the following tables
